

By using sensors placed around planes, high speed processors, and flight monitoring systems, planes are able to mostly fly itself (excluding take off and landing).

# PLANE AUTOPilot

by: Sky Gastinel

This allows for less human error while flying planes, and lets pilots be a bit more hands off. However, it does run the risk of becoming overly complex, too hard for pilots to override if needed.

Thus, allowing society to travel more safely and more easily. Not to dismiss mistakes in autopilot, for when they do occur, they are detrimental.
